About the Talk

"A student is a scientist who does not implement any ideas which sparkles in his brain and decays them inside it". When a student hears a lecture or reads a new concept, there will be several ideas arising in his mind as he takes it in. They could perceive the same novelty in various other perceptions which even the inventor could not have thought. People who are specialized in a particular field would be bound so much to that specified field that it would be very difficult for them to think freely about their novelty in a free man aspect. But still we do not call students great innovators or vanguards because they have not proved that they have that potential of thinking by implementing their ideas. So why is that? Why are students not able to implement the ideas which sparkle in their mind? The talk will explore these points.
